Patent No. 5786158
GENERAL INFORMATION:
ATLAVANIS-TBAKONAS, S. et al.
TITLE OF INVENTION: Therapeutic And Diagnostic Methods
TITLE OF INVENTION: And Compositions Based On No. 5786158ch Proteins And
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 16, Application US/08185432
Patent No. 5750552
GENERAL INFORMATION:
APPLICANT: Busseau, Isabelle
APPLICANT: Diederich, Robert J.
APPLICANT: Matsuno, Kenji
ITILE OF INVENTION: DELTEX PROTEINS, NUCLEIC ACIDS, AND
ITILE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESSE: PENNIE & EDMONDS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Indentification and quantification of N-linked glycoproteins using hydrazide chemistry, stable isotope labeling and mass spectrometry.";
Nat. Blotechnol. 21:660-66(2003).

-!- FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostetic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attendment substrate for cells.

-!- SUBUNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type
                                                                                                                                                                                                                                                                                          [6] SEQUENCE OF 1-21 FROM N.A. "Wurine homologs of deltex define a novel gene family involved in
T vertebrate Notch signaling and neurogenesis.";
Int. J. Dev. Neurosci. 19:21-35(2001).
Int. J. Dev. Neurosci. 19:21-35(2001).
Int. J. Aggedl. Jaggedl and Deltal to regulate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with
RBP-J kappa and activates genes of the enhancer of split locus.
Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation and/or differentiation. May be involved in mesoderm
                                               Logeat F., Bessia C., Brou C., LeBail O., Jarriault S., Seidah N.G.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         development, somite formation and neurogenesis. Involved in mesoder maturation of both CD4+ and CD8+ cells in the thymus. SUBJUIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(TM) and a N-terminal fragment N(TM) and a N-bonds. Interacts with DTX1 and DTX2. SUBJUITAR LOCATION: Type I membrane protein, Following proteolytical processing NICD is translocated to the nucleus. ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                POST-TRANSLATIONAL PROCESSING.

                      from the membrane.
-!- PTM: Phosphorylated.
-!- SIMILARITY: Belongs to the NOTCH family.
-!- SIMILARITY: Contains 36 EGF-like domains.
-!- SIMILARITY: Contains 5 Lin/Notch repeats.
-!- SIMILARITY: Contains 5 ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                        EMBL; 211886; CAA77941.1; EMBL; L02613; AAX14898.1; EMBL; X68278; CAA48339.1; EMBL; AJ238029; CAB40733.1; EMBL; X82562; CAB40733.1; PIR; A46019; A46019; PIR; B49175; B49175; HSSP; P00740; 1EDM: MGD; MGI:97363; Notch1.

1. U. Comp. Neurol. 436:167-181(2001).

1. TUNCTION: Functions as a receptor for membrane-bound ligands Jagged2, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptocic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte suppression.

1. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

2. SUBCELLULAR LOCATION: Type I membrane protein. Following proceeding NICD is translocated to the nucleus (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. Found in both subventricular and ventricular germinal zones. DEVELOPMENTAL STAGE: In the embryo, highest levels occur between days 12 and 14 and decrease rapidly to much lower levels in the adult.

-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EO). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NRXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

C-I- PTM: Phosphorylated (By similarity).

C-I- SIMILARITY: Contains 3 in/Notch repeats.
                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Probable cytosol aminopeptidase (EC 3.4.11.1) (Leucine aminopeptidase)
PEPA OR BSU32050.

similarity).
-1- CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-Xbb-, in which Xaa is preferably Leu, but may be other amino acids including Pro although not Arg or Lys, and Xbb may be Pro.
-1- COFACTOR: Binds 2 manganese ions per subunit (By similarity).
-1- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-1- SIMILARITY: Belongs to peptidase family M17.

                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nature 390:249-256(1997).
-I- FUNCTION: Presumably involved in the processing and regular turnover of intracellular process. Catalyzes the removal of unsubstituted N-terminal amino acids from various peptides (By

Banks A., Leiman J., Ward D., Ish-Horowitz D., Artavanis-Tsakonas S.;

"Human ligands of the Notch receptor.";

Am. J. Pathol. 154:785-794(1999).

-!- FUNCTION: Functions as a receptor for membrane-bound ligands of the Notch receptor for membrane-bound ligands C. Upon ligand activation through the released notch intracellular Upon ligand activation through the released notch intracellular to mannia (NCD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.

Affects the implementation of differentiation, proliferation and appropriate programs (By similarity).

-I- SUBGINT: Heterodimer of a C-terminal fragment N(RC) which are probably linked by disulfide bonds (By similarity).

-I- SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

-I TISSUE SPECIFICITY: Ubiquitously expressed in fetal and adult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    c.-i. PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(EM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

-i. PTM: Phosphorylated (By similarity).

-i. DISBASE: Defects in NOTCH3 are associated with cerebral autosomal domainant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) [MIM:125310]. CADASIL causes a type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VARIANT CADASIL 114-GLY--PRO-120 DEL.

of stroke and dementia of which key features include recurrent subcortical ischemic events and vascular dementia.
-!- SIMILARITY: Belongs to the NOTCH family.
-!- SIMILARITY: Contains 34 EGF-like domains.
-!- SIMILARITY: Contains 3 Lin/Notch repeats.
-!- SIMILARITY: Contains 5 ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        L) AF058800; AAC14346.1; AF058881; AAC14346.1; JOINED.         LDEVELOPMENTAL STAGE: Expressed in the embryonic ventricular zone, the postnatal ependymal cells, and the choroid plexus throughout the postnatal development.

"He postnatal evelopment.

"FTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furni-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TW) and a N-terminal fragment of the converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a form the motth of the peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDITE=21374376; PubMed=1145991;

"Gomen ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RAB-U kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in specification and/or differentiation.
